Long Horizon Agents Hackathon · San Francisco · 25 Sep 2026

Vendors have vendors

- Every vendor passes company data on to its own **sub-processors**.
- Vendors can change this list, or their **data policy, any day**. The only sign is an edit to a web page like this one.
- **GDPR Article 28** requires notice of the change, with time to object.
- The change turns up at the **next audit**, or from a customer.

larkspur.com/legal/subprocessors		changed 25 Sep
Amazon Web Services		Ireland
Google Cloud		Belgium
Twilio		United States
+ Orbit Data Services		Brazil
Zendesk		United States

One row added. No email sent. Fictional vendor.

Live demo

- **Night's Watch Inc.** uses five vendors: AWS, Nimble, Tinybird, Liquid AI, Black Forest Labs.
- Its rules: **R1** approved countries only.
R2 no AI training on customer data.
R3 retention of 90 days or less.
- We make three changes to the **Tinybird demo mirror** and run a tick after each.
- A date edit is **dropped**. The other two turn the node **red**.

Tinybird (demo mirror)		one tick after each change
1	"Last updated" date changes	dropped
2	DataHarvest Ltd added as a sub-processor	R1 alert
3	Privacy policy now allows AI training	R2 alert

The mirror is a copy on our own site. The real Tinybird page is not changed.

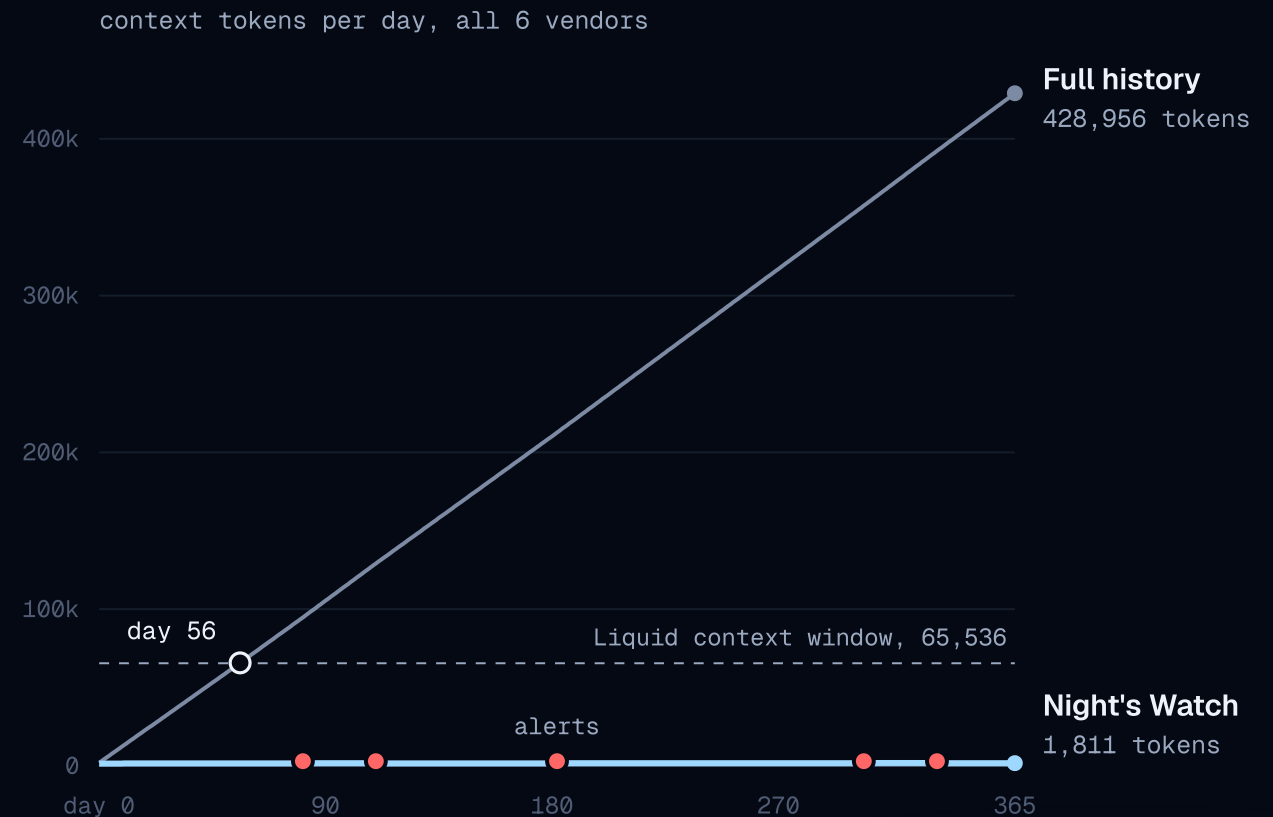

How it works

- **Nimble** reads each vendor's sub-processor list and privacy policy.
- Unchanged pages and date-only edits are **dropped** before any model call.
- **Liquid LFM2.5** judges each new policy sentence. A second model reviews the few that would change a verdict.
- The agent starts from its **state card**, rewrites it, and pulls older history from **RawTree** only when it needs it.

A year, simulated

- Six vendors, 365 days, five planted rule breaks. **5 of 5** caught, no false alerts.
- Context for all six state cards: **1,542 to 1,811 tokens**.
- An agent that keeps the full history needs **428,956 tokens** on day 365. It passes Liquid's window on **day 56**.
- 8 crashes injected over 60 days. Memory came back **identical**.

Simulated, 6 vendors, seed 7. Full-history tokens are computed with the same estimate, not run.
